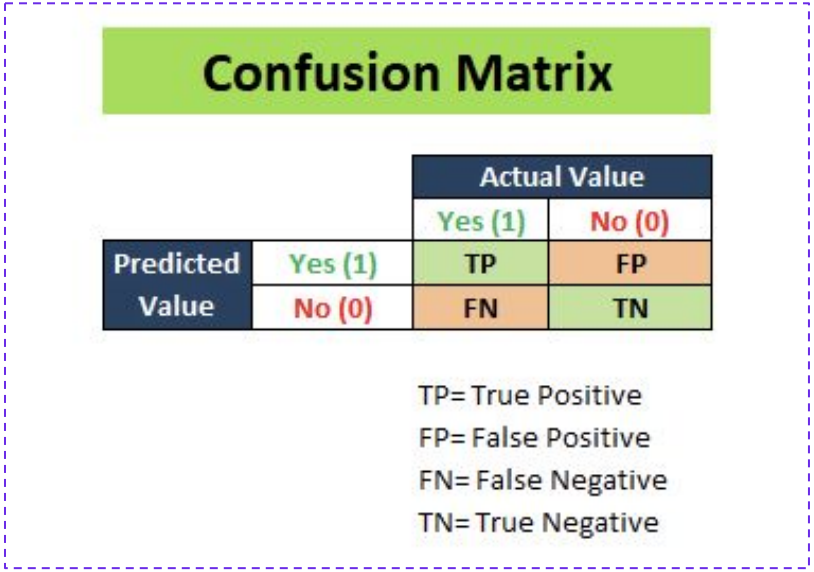
Spring 2024

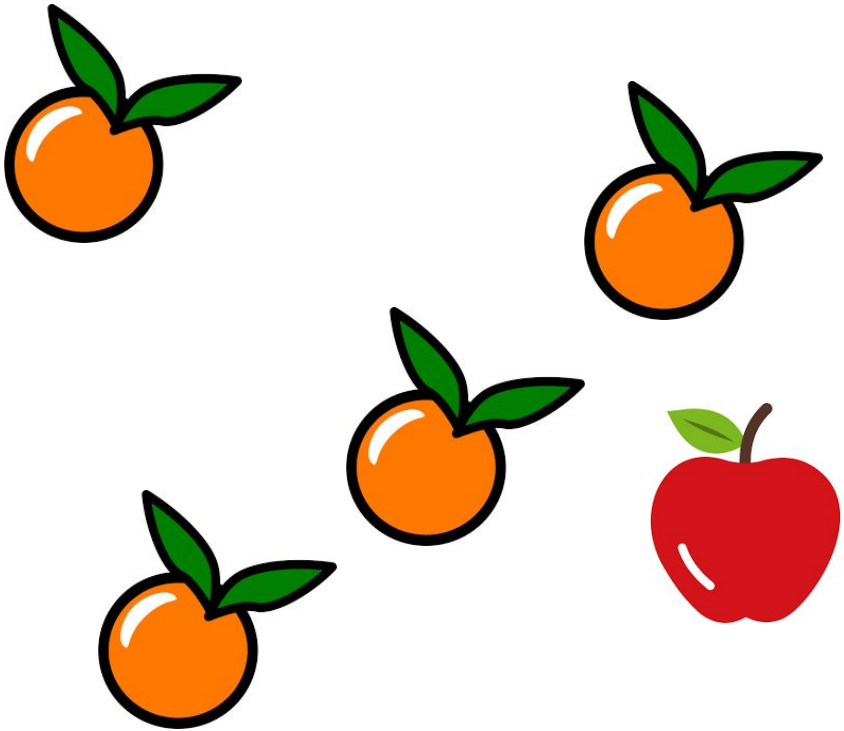
Week 5

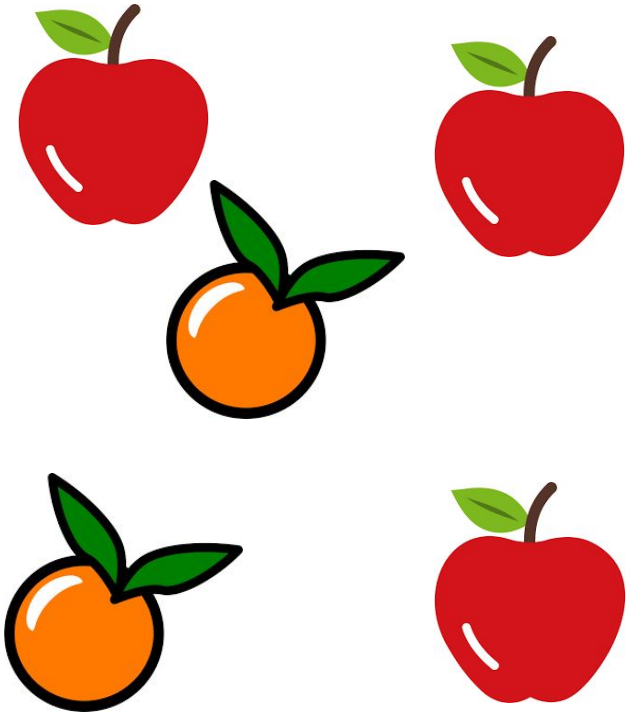
Classification Metrics



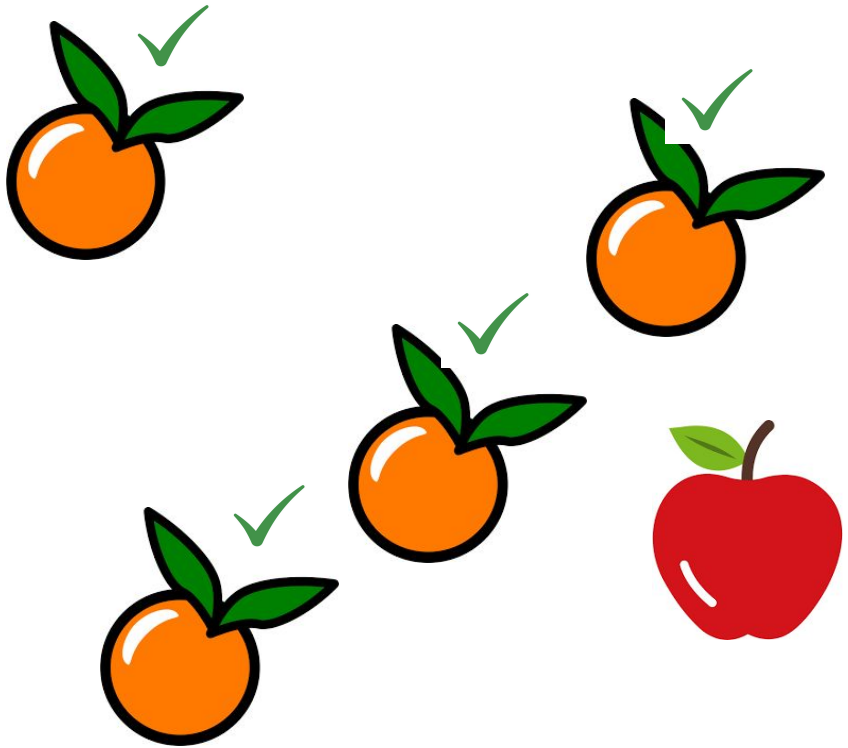
- If you have supervised data, you will want to maximize an objective function.
  - **Precision**: $TP \div (TP + FP)$ % positives correctly identifed
  - **Recall**: $TP \div (TP + FN)$ % existing positives identified
  - **Optimal point** on ROC (precision/recall) curve
  - **Accuracy**: $(TP + TN) \div (TP + TN + FP + FN)$
  - **F-test**: $2 \cdot (P \cdot R) \div (P + R)$

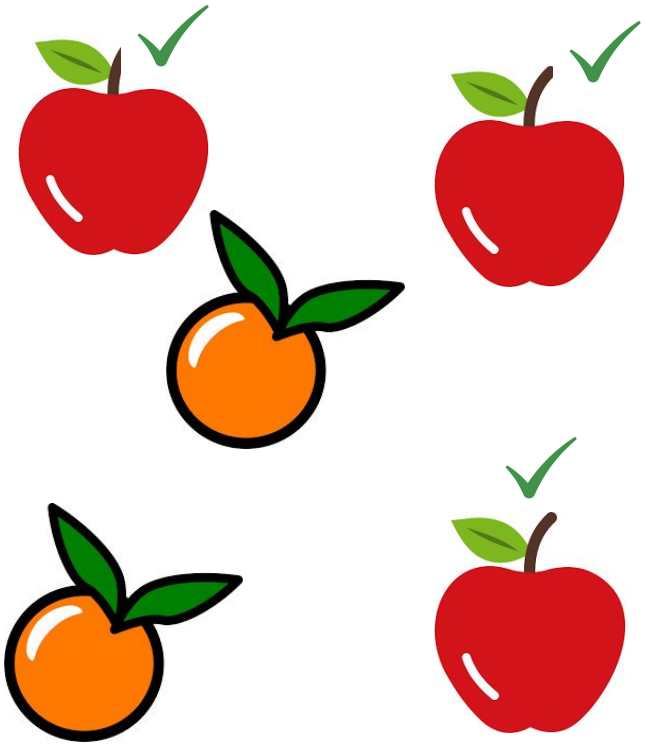
Precision and Recall





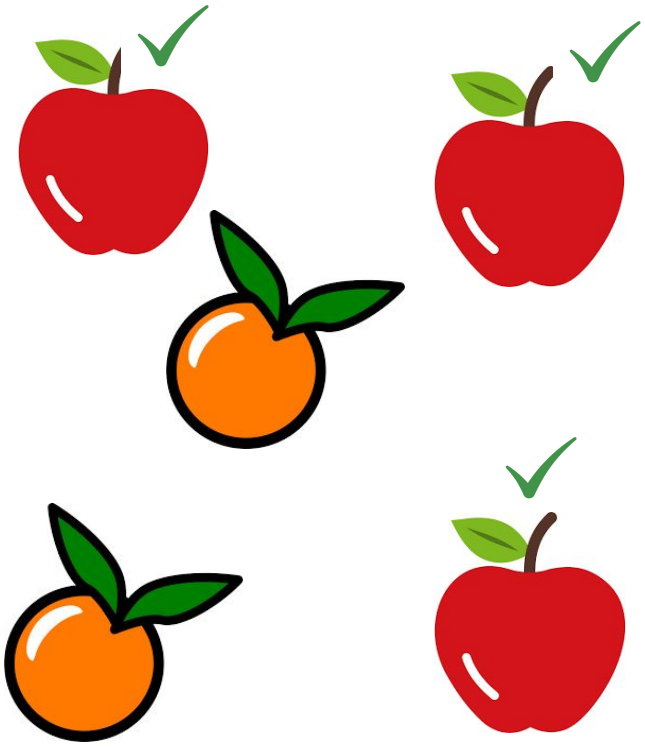
Precision and Recall





Precision

(Total apples correct)/ (Total apple side observations)
= ⅗ = 60%



Recall

(Total number of apples correct)/ (Total actual apples)
= ¾ = 75%

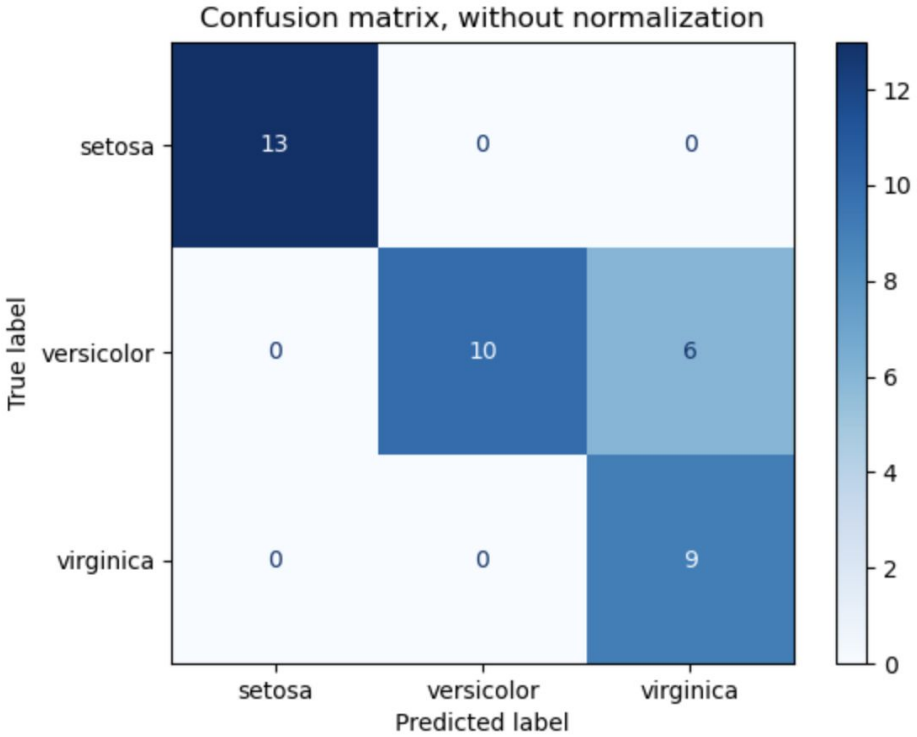
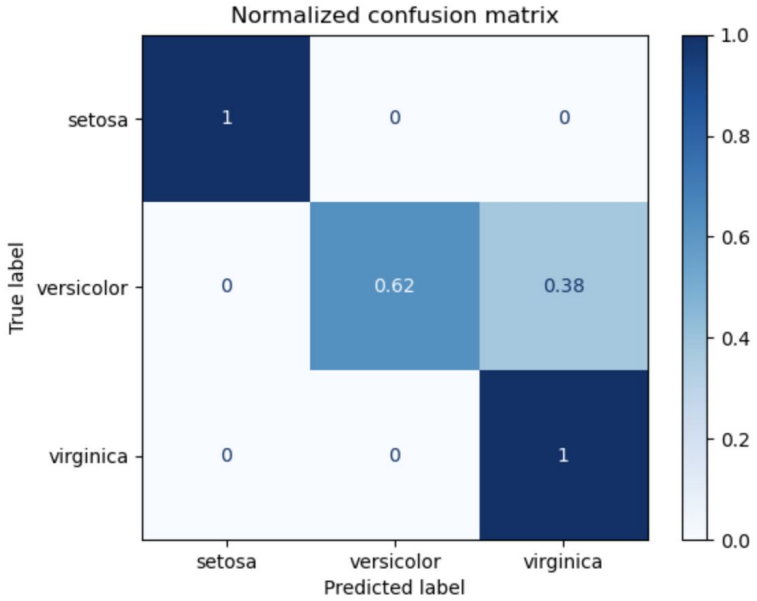
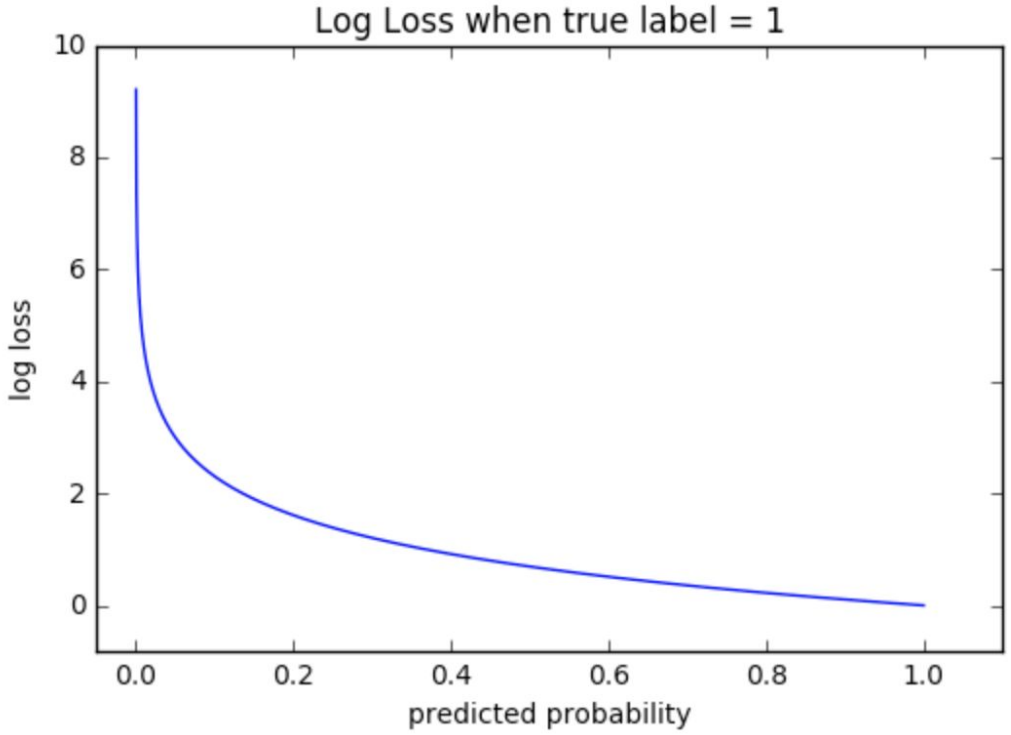
Multiclass Classification Confusion Matrix





Cross Entropy



$$-(y \log(p) + (1 - y) \log(1 - p))$$

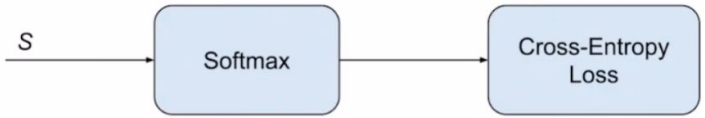
$$-\sum_{c=1}^{M} y_{o,c} \log(p_{o,c})$$

Categorical Cross Entropy Loss (Softmax Loss)

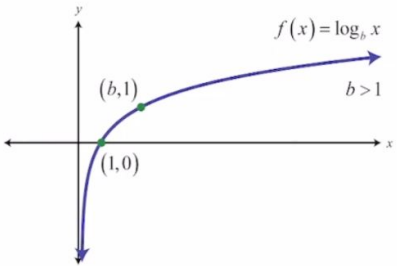
- It is a Softmax activation plus a cross-entropy loss

$$CE = -log\left(\frac{e^{s_p}}{\sum_j^C e^{s_j}}\right) =$$

Sp is the positive class



$$f(s)_i = \frac{e^{s_i}}{\sum_j^C e^{s_j}} \qquad CE = -\sum_i^C t_i log(f(s)_i)$$



- Example:

True Label: Rabbit

Prediction: Dog = 1, Cat = 4, Rabbit = 8, Squirrel = 2

Softmax : D = e^1/SUM, C = e^4/SUM, R = e^8/SUM, S = e^2/SUM

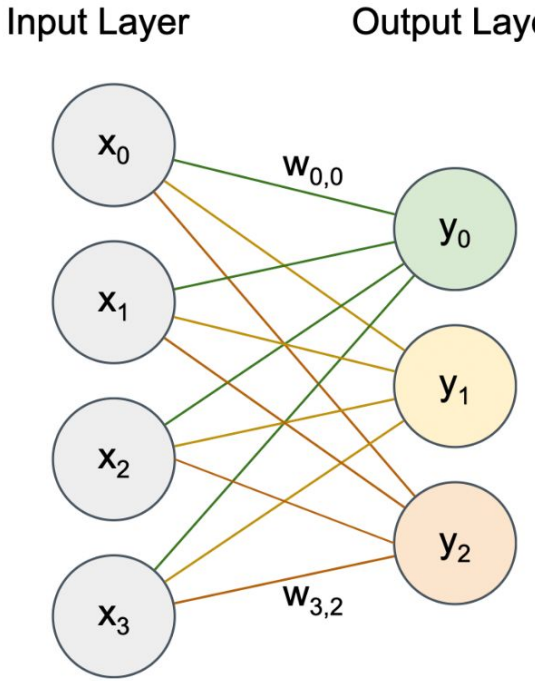
CE Loss = - (0 * ln(D) + 0 * ln(C) + 1 * ln(R) + 0 * ln(S))

= - (0 + 0 + (-?) + 0)

= + ?

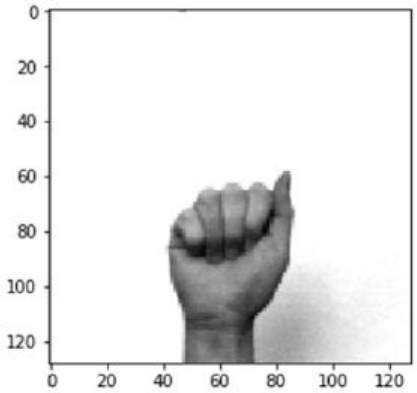
Only the positive class contributes to the CE loss!

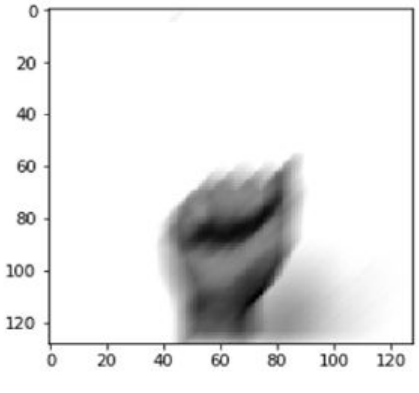
Logistic Regression Network Graph

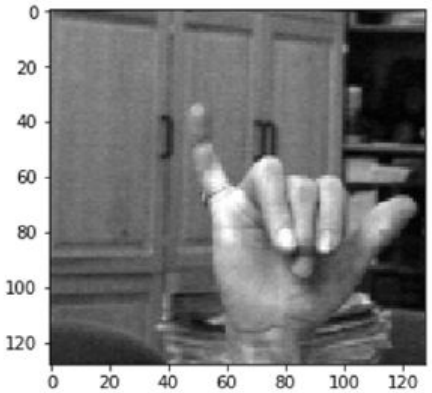


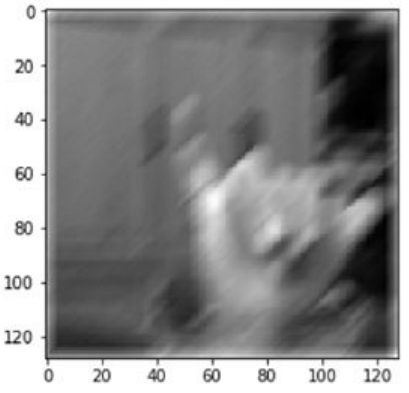
$$\begin{pmatrix} x_{0,0} & x_{0,1} & x_{0,2} & x_{0,3} \\ x_{1,0} & x_{1,1} & x_{1,2} & x_{1,3} \end{pmatrix} \begin{pmatrix} w_{0,0} & w_{0,1} & w_{0,2} \\ w_{1,0} & w_{1,1} & w_{1,2} \\ w_{2,0} & w_{2,1} & w_{2,2} \\ w_{3,0} & w_{3,1} & w_{3,2} \end{pmatrix} \xrightarrow{\sigma} \begin{pmatrix} y_{0,0} & y_{0,1} & y_{0,2} \\ y_{1,0} & y_{1,1} & y_{1,2} \end{pmatrix}$$

Linear Model Limitations



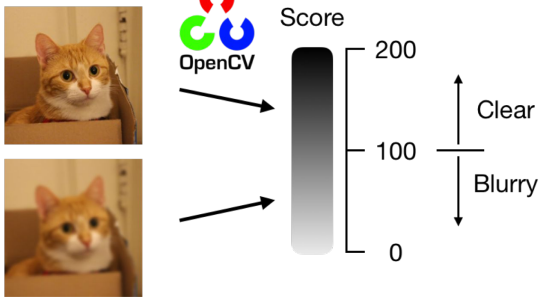






- 1000 clear images
- 1000 blurry images

85% accuracy



Convolution Operation

Input

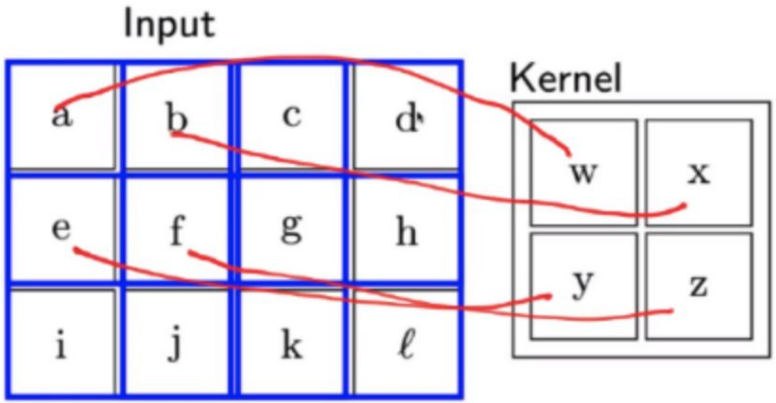
a	b	c	d
e	f	g	h
i	j	k	ℓ

Kernel

w	x
y	z

$$S_{ij} = (I * K)_{ij} = \sum_{a=0}^{m-1} \sum_{b=0}^{n-1} I_{i+a,j+b} K_{a,b}$$

Convolution Operation



aw+bx+ey+fz	bw+cx+fy+gz	cw+dx+gy+hz
