Week 2

# Outline

- Introduction to Regression Analysis
  - Notations and Examples
  - Methodology
  - Evaluation using R-squared
- Introduction to Gradient Descent
  - Methodology
  - Learning Rate
  - Example - House Price Prediction Problem
  - Gradient Descent using Single Variable
  - Gradient Descent using Multiple Variables
  - Types of Gradient Descent

# Introduction to Regression Analysis

Regression analysis is a set of statistical methods used for the estimation of relationships between a dependent variable and one or more independent variables.

It can be utilized to assess the strength of the relationship between variables and for modeling the future relationship between them.

## Applications

1. Forecasting
2. Capital Asset Pricing Model (CAPM)
3. Comparing with competition
4. Identifying problems
5. Reliable Source

The diagram shows the linear regression equation  $Y_i = \beta_0 + \beta_1 X_i$  enclosed in a dashed red box. Arrows point from descriptive labels to each term in the equation:  $Y_i$  is labeled 'Dependent Variable' with an upward arrow;  $\beta_0$  is labeled 'Constant/Intercept' with a downward arrow;  $\beta_1$  is labeled 'Slope/Coefficient' with an upward arrow; and  $X_i$  is labeled 'Independent Variable' with a downward arrow.

$$Y_i = \beta_0 + \beta_1 X_i$$

# Introduction to Regression Analysis: Example

# Introduction to Regression Analysis: Notations

## Subscript Notation

$$y_i = \beta_1 x_{i1} + \cdots + \beta_p x_{ip} + \varepsilon_i = x_i^T \beta + \varepsilon_i$$

$$i = 1, \dots, n$$

## Matrix Notation

$$y = X\beta + \varepsilon$$

$$\mathbf{y} = \begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{pmatrix}, \quad \mathbf{X} = \begin{pmatrix} \mathbf{x}_1^T \\ \mathbf{x}_2^T \\ \vdots \\ \mathbf{x}_n^T \end{pmatrix} = \begin{pmatrix} x_{11} & \cdots & x_{1p} \\ x_{21} & \cdots & x_{2p} \\ \vdots & \ddots & \vdots \\ x_{n1} & \cdots & x_{np} \end{pmatrix}, \quad \boldsymbol{\beta} = \begin{pmatrix} \beta_1 \\ \beta_2 \\ \vdots \\ \beta_p \end{pmatrix}, \quad \boldsymbol{\varepsilon} = \begin{pmatrix} \varepsilon_1 \\ \varepsilon_2 \\ \vdots \\ \varepsilon_n \end{pmatrix}$$

$R^2 = 1$

# Introduction to Gradient Descent

Gradient Descent is an optimization algorithm for finding a local minimum of a differentiable function.

Gradient descent is simply used in machine learning to find the values of a function's parameters (coefficients) that minimize a cost function as far as possible.

It's based on a convex function and tweaks its parameters iteratively to minimize a given function to its local minimum.

**"A gradient measures how much the output of a function changes if you change the inputs a little bit." —Lex Fridman (MIT)**

A gradient is a derivative of a function that has more than one input variable.

Known as the slope of a function in mathematical terms, the gradient simply measures the change in all weights with regard to the change in error.

# Introduction to Gradient Descent : Analysis and Methodology

$$\mathbf{b} = \mathbf{a} - \gamma \nabla f(\mathbf{a})$$

## Introduction to Gradient Descent : Learning Rate

# Introduction to Gradient Descent : Example

House Size sq.ft (X)	1400	1600	1700	1875	1100	1550	2350	2450	1425	1700
House Price\$ (Y)	245,000	312,000	279,000	308,000	199,000	219,000	405,000	324,000	319,000	255,000

Given its size (X), what will its price (Y) be?

# Introduction to Gradient Descent : Example

$$\begin{aligned}\text{Sum of Squared Errors (SSE)} &= \frac{1}{2} \text{Sum (Actual House Price - Predicted House Price)}^2 \\ &= \frac{1}{2} \text{Sum}(Y - Y_{\text{pred}})^2\end{aligned}$$

# Introduction to Gradient Descent : Example - Steps

Step 1: Initialize the weights( $a$  &  $b$ ) with random values and calculate Error (SSE)

Step 2: Calculate the gradient i.e. change in SSE when the weights ( $a$  &  $b$ ) are changed by a very small value from their original randomly initialized value. This helps us move the values of  $a$  &  $b$  in the direction in which SSE is minimized.

Step 3: Adjust the weights with the gradients to reach the optimal values where SSE is minimized

Step 4: Use the new weights for prediction and to calculate the new SSE

Step 5: Repeat steps 2 and 3 till further adjustments to weights doesn't significantly reduce the Error

# Introduction to Gradient Descent : Example

HOUSING DATA
